Research Setting

Knowledge
Knowledge management
⇒ Organisations & their business processes

• **Problems** in management of dynamic context-dependent changes
  • identification of KM elements in organisations & impact factors
  • definition of KM processes according to their business
  • establishment of methods & supporting systems
Knowledge

• bunch of “facts, feelings, or experiences known by a person or group of people”
• combination of information, skills, experiences, & personal capability of people
• in artefacts people produce
• in communications they carry out
• at the places they work and live

• related to people, products, processes, or culture
Research on Knowledge

(Kalpic & Bernus, 2006)
Research on Knowledge

- individual knowledge = content knowledge
- preserved, transferred, shared
- challenge: management of organisational or collective knowledge = schema knowledge
- knowledge life-cycles

(Nonaka & Tekeuchi, 1995)
Knowledge Management

- capture, store, exchange, retrieve valued information
- active management of knowledge in an organisation by using systematic processes
- to transport knowledge from those who have it to those who needs it
- to keep knowledge in the organisation
KM Approaches

- generation, codification, transfer, application
- sharing, utilisation, storage, refinement
- acquisition, indexing, filtering, classification, cataloging and integrating, distributing, and application
- procure, organise, store, maintain, analyse, create, present, distribute, and apply
- acquiring, selecting, internalising, and using
- storage and retrieval, sharing and synthesis
- …
KM in Industrial Context

- technology-push model ⇒ process-focus
- study of SMEs
- product- vs. service-based SMEs
- low- vs. high-volatility context
- 12 steps to implement KM ⇒ framework & methodology for the implementation
- own survey on KM and sharing
KM in Industrial Context

• to understand social network services and their private & professional use
• 31 questions on
  • popularity and availability of SNS for private and professional use
  • areas of application with the duration of use, motivation, features used
  • integration into the daily work
  • possible impacts on one's own work processes
• 282 answers evaluated
KM in Industrial Context

• Organisations use only certain SNS and applications, like Skype, blogs, Windows Live Spaces, RSS feeds. Skype, mainly its IP-based telephony feature, is the most and longest used application for communication.

• 68% mean that the collaboration with other organisations or partners is the same with SNS as it was without using them, whereas 31% see an improvement in collaboration processes when SNS are applied.
KM in Industrial Context

- Among the ones who found that SNS improve the collaboration processes, 30% found that SNS speed everything in business organisation and work processes, and the coordination of work becomes easier.

- 21% found that the distribution of work can be carried out faster and easier, and additional 18% meant that there are other advantages of the use of SNS in organisations.
KM in Industrial Context

- 41% perceived that SNS ease the cooperation at all.

- 73% would recommend the use of SNS in business processes to their existing and new partners.

- 64% would use SNS again in the future projects, 15% would not use them any more.
KM in Industrial Context

- 66% of the SNS users want to separate their private contacts and exchange with others from the ones which are work-related, whereas 16% currently make no difference between private and professional, but can imagine to do that in the future, and 18% do not see the need to separate them.
So what?

- correlation between business processes and knowledge management
- organisations host structured predictable and unstructured situated processes at the same time
- dependant on the knowledge available to carry out the particular activities included in processes
- unexpected contingencies arise at work
Findings (1)

Based on research in MAPPER (EU project)

• how organisations can be characterised depending on their main activities, business focus, and organisation of work
• differentiate time-, product-, or service-based organisations
• help analyse the organisational context and economic, environmental, cultural circumstances
• define and analyse processes, management, coordination and cooperation issues, success factors in such organisations, by focusing on knowledge management processes to provide support for organisations
Findings (2)

Time-based Organisations

- deadlines drive everything
- temporal conditions define interdependencies
- time-based project plan
- temporal space for improvisations in case of unexpected contingencies \(\Rightarrow\) changes in business processes
- simultaneity & ad-hoc changes in resource allocation
- distributed decision-making
- meetings
- success: meet deadlines, delivering expected results in the restricted time
Findings (3) Product–oriented Organisations

- product – subparts
- subparts assigned to persons
- interdependencies between subparts, change over time
- coordination protocols: interfaces, deadlines, quality & quantity
- central decision–making
- monitoring, intervention, reallocation
- plans, meetings, tools
- success: product quality, its integrity, completeness, unity
Findings (4)

Service-based Organisations

• predefined, well-structured, routine processes
• persons assigned to processes
• workflow(-like) systems define the processes
• no improvisations
• model & monitor
• intervention, reallocation, reassignment, central decisions
• success: efficient workflow, no deadlocks, no uncertain situations, everything runs as planned, service delivered at the right time to the right people
Findings (5)

Other Impact Factors

- changes in organisations
- dealing with volatility
- dealing with KM and change management practices

⇒ complex process changing over time
